

The Most Constrained: B

Explanatory Note:
This scenario applies current available science, knowledge and information on ecological values and reflects current legislation and land use policies, with the addition of excluding from consideration; natural cover within areas with high capability for agriculture, bedrock aggregate deposit areas, and built up urban areas.
The Most Constrained Scenario results in 44.7% of the available natural cover being selected into the system which accounts for 26% of the land base for the study area. This achieves 54.6% performance relative to the area based value captured under the Baseline Comparator Scenario.
